RESEARCH PROFILE

OVERALL RESEARCH GOALS

Research focuses on understanding, envisioning, and planning of Complex Human-Environment Systems (CHES) through digital, 4-dimensional (x, y, z, time) representation & visualization, computation, space-time analysis, micro-level modeling, and simulation. Complexity theory, landscape ecology, geographic information science, cyberinfrastructure theory and technology, big data science, and other relevant domain knowledge (e.g., sociology, demography) leverage theoretical and methodological support toward this goal.

SPECIFIC INTERESTS AND ACTIVITIES

- 1. Revealing dynamics and mechanisms of complex human-environment systems through international, interdisciplinary, and inter-scale (local-global, short-long term, lower-upper level) research.
- 2. Developing a digital, high performance (big data friendly, parallel/clouds computing enabled, webbased), and 4-D holographic methodology to facilitate geo-representation/visualization, animation, space-time analysis and modeling, and micro-level simulation of various complex human-environment systems (CHES).
- 3. Performing hazard analysis for improved planning (e.g., preparedness, envisioning), management (e.g., response, mitigation), and recovery (trajectory representation, simulation).
- 4. Exploring pathways toward improved human health through better environmental planning, management, and conservation.
- 5. Understanding the past, present, and future of cities and city dwellers in the context of emerging socio-political and environmental challenges.
- 6. Establishing and maintaining various CHES research, education, and outreach networks.
